WAP to implement Hashing using Linear Probing with chaining without replacement.(Hash Function: Key \% table size)

Code:

```
#include <stdio.h>
#define size 10
#define h(x) x % size

void insert(int data[], int flag[], int chain[], int x) {
    int i = 0, j, start;
    start = h(x);

    while (flag[start] && i < size) {
        if (data[start] % size == x % size) {
            break;
        }
        i++;
        start = (start + 1) % size;
    }

    if (i == size) {
        printf("Hash Table is Full");
        return;
    }

    j = start;
    while (chain[j] != -1) {
        j = chain[j];
    }
```

```

while (flag[j] && j < size) {
    j = (j + 1) % size;
}

if (j == size) {
    printf("Hash Table is Full");
    return;
}

data[j] = x;
flag[j] = 1;

if (j != start) {
    chain[j] = chain[start];
    chain[start] = j;
}
}

void display(int data[], int flag[], int chain[]) {
    int i;
    for (i = 0; i < size; i++) {
        if (flag[i]) {
            printf("(%d) %d %d \n", i, data[i], chain[i]);
        } else {
            printf("(%d) -- %d \n", i, chain[i]);
        }
    }
}

int main() {
    int data[size], flag[size], chain[size], i, x, op;

    for (i = 0; i < size; i++) {
        flag[i] = 0;
        chain[i] = -1;
    }
}

```

```

printf("Enter the number of keys to be inserted: ");
scanf("%d", &op);

for (i = 0; i < op; i++) {
    printf("Enter key to be inserted: ");
    scanf("%d", &x);
    insert(data, flag, chain, x);
}

printf("\nHash Table:\n");
display(data, flag, chain);
return 0;
}

```

Output:

```

Enter the number of keys to be inserted: 7
Enter key to be inserted: 19
Enter key to be inserted: 8
Enter key to be inserted: 10
Enter key to be inserted: 20
Enter key to be inserted: 21
Enter key to be inserted: 12
Enter key to be inserted: 11

Hash Table:
(0) 10 1
(1) 20 -1
(2) 21 4
(3) 12 -1
(4) 11 -1
(5) -- -1
(6) -- -1
(7) -- -1
(8) 8 -1
(9) 19 -1
